GrowFi

The capital market for real harvests.

GrowFi turns seasonal production into auditable USDC-funded campaigns with escrow, refunds, staking and onchain settlement.

PROBLEM

Regenerative production needs capital before revenue exists.

Growers carry seasonal costs before harvest. Investors want transparent exposure to productive real assets, but today the operating data, settlement rules and downside protections are usually offline.

Cashflow mismatch

Seeds, labor, processing, logistics and land operations are funded before the harvest produces cash.

Trust gap

Investors see stories instead of verifiable campaign state, refund rules and settlement accounting.

No market layer

Productive assets remain fragmented because campaign rights, repayment and liquidity are not standardized.

GrowFi turns production finance into a campaign primitive investors can inspect.

SOLUTION

One campaign packages funding, rights and settlement.

GrowFi converts each productive project into a self-contained onchain campaign: investors fund in USDC, receive campaign exposure, earn seasonal yield and settle against product or repayment.

01 Fund

USDC enters escrow until campaign activation.

02 Stake

Campaign positions earn seasonal $YIELD.

03 Settle

$YIELD burns for product or pro-rata USDC.

04 Recycle

Investors restake, sell back or rotate capital.

LIVE PROOF

The protocol is live on Ethereum mainnet.

The investor story is no longer a future launch. Campaign creation, USDC funding, $GROW treasury automation, staking, producer verification and settlement run on production contracts.

Ethereum L1

Verified supply

Producer profile and KYC signals

BUSINESS MODEL

GrowFi monetizes protocol flows, not attention.

Fees are explicit per flow, while $GROW connects campaign activity to treasury, staking and long-term protocol participation.

Campaign buy	3%	Primary funding flow
Harvest deposit	2%	Producer settlement flow
Repayment redeem	2%	Early-exit payout flow
Ecommerce	3%	Onchain product sales
Direct $GROW	10% markup	Stablecoin purchase path

$GROW flywheel

Treasury reserves, staking rewards and campaign allocations reinforce each other as funded supply grows.

treasury · staking · allocation

TEAM

Lived the problem. Built the protocol.

The founding team combines regenerative asset operations, smart-contract systems and EU regulatory structuring.

RA

Regen Avocado

Co-Founder · CEO

Built and self-financed regenerative agroforestry sites; brings the operator view of production finance.

TL

turinglabs.eth

Co-Founder · CTO

Smart-contract architect across staking, RWA flows and production protocol infrastructure.

SLF

SLF

Legal partner

Web3 and EU regulatory counsel; supports non-custodial, MiCA-aware structuring.

ROUND

$50K angel round by end 2026, larger round in 2027.

The angel round funds near-term proof: audit readiness, producer onboarding, campaign data and investor diligence before the larger growth round.

$50K	**End 2026**	**2027**	**Live**
Angel round	Target close	Larger round	Mainnet rollout

Audit readiness

INVESTOR ACCESS

Back the mainnet rollout for real harvest finance.

Request the walkthrough, review the contracts and diligence materials, and discuss the angel allocation before the 2027 growth round.
